

Time course of processing external and internal features in face matching tasks

Original title / Originaltitel

Zeitverlauf der Verarbeitung externer und interner Merkmale bei Gesichtervergleichsaufgaben

Summary / Zusammenfassung

The aim of this research project is to systematically investigate the time course of processing internal and external features in face matching tasks with regard to a) face familiarity, b) orientation (upright or inverted), c) other race effect, and d) different viewpoints (frontal or side view). These investigations will result in a deeper understanding of the time-course, relevant representations, and processes in face matching. Besides this theoretical contribution, the knowledge gained from these studies could also have important implications for applied tasks in which face matching is used, e.g. in passport verification at airports.
